Points, Lines, and Planes

Understanding the fundamental elements of geometry begins with points, lines, and planes. Points are exact locations with no size; lines extend infinitely in both directions, and planes are flat surfaces extending infinitely in all directions. Key concepts include:

- **Collinearity:** Two or more points lying on the same line. For example, points that are collinear to point (K) are all points on the same straight line passing through (K) .
- **Coplanarity:** Points or lines lying on the same plane. For instance, points that are coplanar to plane (R) all reside within that flat surface.
- **Line and Plane Intersections:** Lines can intersect planes at a single point, or be contained within a plane. The intersection of a line (c) with plane (R) is a specific point where the line passes through the plane.
- **Non-Coplanar Points:** Points not lying on the same plane, such as a point outside plane (R) , are non-coplanar, indicating three-dimensional relationships.

Segment Addition Postulate

This postulate states that if point (D) lies between points (D) and (F) , then:

$$[DE + EF = DF]$$

It allows us to find unknown segment lengths when parts of a segment are known. For example:
