

## MEASUREMENT OF VISUALLY EVOKED POTENTIAL

**AIM:**

To analyse the nature of visually evoked potential using EEG recorder

**APPARATUS REQUIRED:**

S. No	Name of the Equipment	Quantity
1	EEG Recorder	1
2	Flash Light	1
3	Montages	1

**THEORY:**

Electrical potentials that occur in the cortex after stimulation of a sense organ which can be recorded by surface electrodes are known as Evoked Potential. Example: SEP, ABR and VEP.

Evoked potentials test and record how quickly and completely the nerve signals reach the brain. Evoked potentials are used because they can indicate problems along nerve pathways that are too subtle to show up during a neurologic examination or to be noticed by the patient. The disruption may not even be visible on MRI exam. These tests can be helpful in making the diagnosis of multiple sclerosis (MS) and other neurological disorders. Evoked potential amplitudes tend to be low, ranging from less than a microvolt to several microvolt's, compared to tens of micro volts for EEG, mill volts for EMG, and often close to a volt for ECG. Signals can be recorded from cerebral cortex, brain stem, spinal cord and peripheral nerves. Usually the term "evoked potential" is reserved for responses involving either recording from, or stimulation of, central nervous system structures.

**Types:**

- Visual Evoked Potentials (VEP)
- Auditory Evoked Potentials (AEP)
- Sensory Evoked Potentials (SEP)

**VISUAL EVOKED RESPONSE (VEP):**

The VEP tests the function of the visual pathway from the retina to the occipital cortex. It assesses the integrity of the visual pathways from the optic nerve, optic chiasm, and optic radiations to the occipital cortex. Visual evoked potential (VEP) tests evaluate how the visual system responds to light. VEP tests used to evaluate optic neuritis, optic tumours, retinal disorders, and demyelinating diseases such as multiple sclerosis.
