

Structure, Bonding and properties

1. Why do atoms bond together?

Some atoms are very reluctant to combine with other atoms and exist in the air around us as single atoms. These are the **Noble Gases** and have **very stable electron arrangements** eg **2, 2.8** and **2.8.8** because their outer shells are full. The first three are shown in the diagrams below and explains why Noble Gases are so reluctant to form compounds with other elements.

All other atoms therefore, bond together to become electronically more stable, that is to become like Noble Gases in electron arrangement. Bonding produces new substances and usually involves only the 'outer shell' or 'valency' electrons

The phrase **CHEMICAL BOND** refers to the strong electrical force of attraction between the atoms or ions in the structure. The combining power of an atom is sometimes referred to as its **valency** and its value is linked to the number of outer electrons of the original uncombined atom.

COVALENT BONDING - **sharing electrons** to form **molecules** with **covalent bonds**, the bond is usually formed between **two non-metallic elements** in a molecule.

IONIC BONDING - By one atom **transferring electrons** to another atom.

COORDINATE COVALENT BONDING A coordinate covalent bond is special because it involves a shared pair of electrons that came from a single atom.

METALLIC BONDING The **crystal lattice of metals** consists of **ions NOT atoms** surrounded by a 'sea of electrons' forming **giant lattice**. These free or 'delocalised' electrons are the 'electronic glue' holding the particles together. There is a **strong electrical force of attraction** between these **mobile electrons (-)** and the 'immobile' **positive metal ions (+)** and this is the **metallic bond**.

- An ion is an atom or group of atoms carrying an overall **positive** or **negative** charge
 - eg Na^+ , Cl^- , $[\text{Cu}(\text{H}_2\text{O})]^{2+}$, SO_4^{2-} etc.
- If a particle, as in a neutral atom, has equal numbers of protons (+) and electrons (-) the particle charge is zero ie no overall electric charge.
- The proton number in an atom does not change BUT the number of associated electrons can!
- If negative electrons are removed the excess charge from the protons produces an overall positive ion.
- If negative electrons are gained, there is an excess of negative charge, so a negative ion is formed.
- The charge on the ion is numerically related to the number of electrons transferred.
- For any atom or group of atoms, for every electron gained you get a one unit increase in negative charge, for every electron lost you get a one unit increase in the positive

The atom **losing electrons** forms a **positive ion (cation)** and is usually a **metal**.

The atom **gaining electrons** forms a **negative ion (anion)** and is usually a **non-metallic element**.

Chimenti,2012-12-06 It has been shown both experimentally 2 and theoretically 2 3 that surface skimming SH waves propagating along symmetry axes of the texture have velocities that differ in proportion to the magnitude of any stress that lies along one of the symmetry axes Specifically the stress is directly proportional to the relative velocity difference through the equation $V_{ik} = V_{ki} + \frac{1}{2G} \tau_{ik}$ where τ_{ik} is the stress in the direction i G is the shear modulus and V_{ik} is the velocity of an SH wave propagating in the i direction and polarized in the k direction This rather simple relationship is particularly useful because the constant of proportionality involves only the well known shear modulus and the velocity term can be measured directly by observing the transit time shift when a transmitter receiver pair of SH wave transducers are rotated through 90 degrees on the surface of the part Experimentally Equation I was tested on the web of railroad rails which had been loaded by a 200 000 pound mechanical testing machine I The method of exciting and detecting the necessary surface skimming SH waves used electromagnetic acoustic transducers EMATs that operated through a magnetostrictive mechanism at high magnetic fields 4 Wave velocities parallel and perpendicular to the axis of the rail on the web differed by the amount predicted by Equation I to an absolute accuracy of 30 percent in the worst case
