### 2.4.01 Properties of Cell Membrane Phospholipids

(1402A.1)

Cell (or plasma) membranes separate the inside of a cell or organelle from its surrounding environment. Membranes are mainly made of phospholipids, which have two basic parts: a polar head group and two nonpolar fatty acid tails, as shown in Figure 2.13.

The phospholipid head contains a phosphate group and is polar (i.e., *hydrophilic*), meaning it interacts well with water. The head group consists of glycerol attached to a phosphate group, which is typically attached to another variable chemical group (known as R) such as choline or serine. The fatty acid tails are nonpolar (i.e., *hydrophobic*) and tend to avoid water.

Figure 2.13 Cell membranes are made of phospholipids arranged in a bilayer.
