

# DENSITY AND BUOYANCY

**Density and Buoyancy**

Name: \_\_\_\_\_

**Reading Passage**

Read the passage carefully before answering the questions that follow.

Density is a measure of how much mass is contained within a certain volume of a substance. It is calculated by dividing an object's mass by its volume and is expressed in units such as grams per cubic centimeter (g/cm<sup>3</sup>). Substances with higher density than water, such as metals, sink in water, while substances with lower density than water, such as oil, float. The density of a substance is a constant property that does not change with the amount of the substance.

The buoyant force experienced by an object submerged in a fluid depends on the fluid's density and the volume of fluid displaced by the object. This principle, known as Archimedes' principle, explains why ships made of steel can float, although steel is much denser than water. The shape of a ship's hull allows a large volume of water, creating enough buoyant force to keep it afloat. Density, too, can influence the behavior of an object in a fluid. For example, a hot air balloon rises because the air inside is less dense than the air outside, resulting in a buoyant force that pushes the balloon upward.

Differences in density are also responsible for many natural phenomena. For instance, ice floats on water because it has a lower density than liquid water. This allows aquatic life to survive beneath the frozen surface. In the ocean, differences in water density, caused by temperature and salinity variations, drive large-scale ocean currents that play a crucial role in Earth's climate system. Understanding density and buoyancy helps us explain these natural processes and has a wide range of practical applications, from engineering to environmental science.

**True or False: Density and Buoyancy Concepts**

Circle whether each statement is True or False.

1. An object with a higher density than water will sink when placed in water. 10
2. A ship floats because it displaces enough water to balance its weight, despite being made of heavy metal. 10
3. Hot air balloons rise because the air inside is denser than the air outside. 10
4. Ice floats on water because it has a lower density than liquid water. 10
5. Objects with less volume displace less fluid and experience less buoyant force. 10
