

# MOLECULAR GENETICS

## Molecular

Read the passage carefully before answering.

### Reading Passage

DNA, or deoxyribonucleic acid, is the molecule that carries the instructions for making organisms. The structure and sequence of nucleotides (consisting of a sugar, a phosphate group, and a nitrogenous base) determine the genetic code. The genetic code is a set of instructions that tells the cell how to make proteins. During DNA replication, the double helix unwinds and each strand serves as a template for creating a new complementary strand, resulting in two DNA molecules.

Transcription is the process whereby a segment of DNA (codon) is copied into the messenger RNA (mRNA). This occurs in the nucleus, where it is then transported to the cytoplasm, where it is translated into a sequence of polypeptides in the ribosomes. The genetic code is a set of instructions that tells the cell how to make proteins. During DNA replication, the double helix unwinds and each strand serves as a template for creating a new complementary strand, resulting in two DNA molecules.

The genetic code is nearly universal among living organisms, indicating that a specific code was used in the early stages of life. The genetic code is a set of instructions that tells the cell how to make proteins. During DNA replication, the double helix unwinds and each strand serves as a template for creating a new complementary strand, resulting in two DNA molecules.
