

Visual Basic® for Applications 2016 Introduction

Visual Basic for Applications (VBA) is the programming language, or code, used to automate tasks in Microsoft Office applications. You can manually compose your own VBA code or have it created for you by recording actions. In either case, the code is played back to repeat tasks, which, when strung together, articulate an entire procedure.

Showing the Developer Tab

Always display the DEVELOPER tab as it provides quick access to macros, VBA code and related security settings.

1. Choose FILE, OPTIONS, then CUSTOMIZE RIBBONS.
2. Click the DEVELOPER tab in the right side of the CUSTOMIZE THE RIBBONS column and [CHECK] OK.

Setting Macro Security

1. Choose DEVELOPER, Macro Security.
2. Choose one of the MACRO SETTINGS, then [Click] OK. Tip: Use the Enable All Macros option when working on your own code.

Organizing VBA Projects

The VBA Editor, contained within each Office application, is used to create and organize VBA code. Its left-side Project Explorer pane lists, in tree style view, a Project, representing the open Office file, plus associated Object or Module folders.

- The Objects folder lists an open file's documents, Microsoft Word Objects.
- The Modules folder lists modules, filled with user created VBA code.
- The code is displayed in a larger pane to the right.
- Code created for a document only applies to that document, while module code applies to any document in the project.

1. Press <Alt>F11 or choose DEVELOPER, VISUAL BASIC.
2. Open the left-side Project Explorer pane, if necessary, with VIEW, PROJECT EXPLORER or <Ctrl>R.

Opening or Creating Code Windows

1. [Double Click] any Project Explorer item to open its code window, if necessary. First open its containing folder by [Clicking] the folder's "+".
2. [Right Click] any Project Explorer item and choose INSERT, MODULE to create a new module.

Project Explorer's tree view is different for each Office application. For example, PowerPoint has no Objects folder, while Excel has a separate object for each worksheet. The naming convention is:

- Excel: Project name + Workbook name or Personalized Object name + Worksheet name.

- Word: Project name + Document name or Personal Object name + TheDocument.
- Access: Project name + Database file name. Object name = Name of form or report.
- PowerPoint: Project name + PowerPoint file name.
- Modules: and module windows are named Module1 (2, 3, ...)

Deleting a Code Window

1. [Right Click] an object or module name in Project Explorer and select REMOVE (window name) ...
2. [Click] NO from the pop-up message unless you want to export the code for archiving.

Creating VBA Code

1. Open an existing code window or add a new module.
2. Position the cursor at the code insertion point, if necessary, and choose INSERT, PROCEDURE.
 - a. Enter a NAME (see Code Name Rules).
 - b. Select SUB to automate tasks with a Subroutine, or FUNCTION to perform customized calculations.
 - c. Select PUBLIC to make your code globally available to any subroutine. PRIVATE will restrict its use to the subroutine being created or modified.
 - d. Select "All local variables as Static" to retain the value of the procedure's variables after code execution ends (e.g., store a running total).
 - e. [Click] OK.
3. Enter your code in an organized way (see Organizing Code).
4. Choose FILE, SAVE (see Saving Code).

Tip: Save time writing code in Excel or Word by recording actions in a Macro, then copying the recorded code to your module.

Running VBA Code

Manually

1. Choose DEVELOPER, MACROS.
2. [Click] the subroutine name in the MACRO NAME list. If the list is too long, restrict it to a specific location from the MACROS IN list.
3. [Click] one of action buttons on the right side: RUN - Run the code to completion. STEP INTO - Run one code line at a time to help you catch errors. For details, see Troubleshooting. EXECUTE - Displays the entire code. DELETE - Deletes the subroutine. OPTIONS - Useful for creating a keyboard shortcut to run the subroutine.

Automatically

VBA subroutines can be triggered by events, but by other subroutines, or start when an Office program starts.

- See Understanding the VBA Language, Using Code Window Lists, and Useful Code Events for examples of event triggering.
- Add the code <code>On Error Resume Next</code> to turn a subroutine from within another subroutine.
- To automatically run code upon opening a document or workbook, create a subroutine called Document_Open() in Word's ThisDocument code window, or a subroutine called Workbook_Open() in Excel's ThisWorkbook code window. Tip: To run a subroutine automatically when an Access database opens, see the steps listed in <http://blogs.msdn.com/officeaccess/vba/>.

Saving Code

Code can only be saved by saving the Office file it is stored in. Default file types for Excel, Word or PowerPoint ("*.xls", "*.docx", "*.pptx) cannot contain macros. Run-time programs.

1. Choose FILE, SAVE or press <Ctrl>S.
2. If a "save new" warning message pops up, [Click] NO.
3. Change VIEW AS TYPE to WORKBOOK (Excel) or WORKBOOK (Word).
4. Choose a location, specify a FILE NAME, then [Click] SAVE.

Saving Global Macros

- Macros, recorded in Excel or Word can be used to be available only to the current workbook/document, or globally for all workbooks or documents. To save a recorded macro globally choose the following from the STORE MACRO IN drop list in the RECORD MACRO dialog box:
- In Excel, choose PERSONAL MACRO WORKBOOK.
 - In Word, don't change the default ALL DOCUMENTS (NORMAL.DOTM) choice.
 - VBA code can also be saved globally if it is manually created under the NORMAL project in Word or the PERSONAL.VBE project in Excel.

Code Name Rules

- Code names must begin with a letter.
- Subsequent characters should only be letters, numbers, or underscores characters.
- Good practice makes names shorter than 25 characters and substitutes underscores for spaces.
- Avoid names that are the same as cell references in Excel or restricted VBA keywords such as ISARRAY.

VBA Editor Tips

- The Project Explorer pane is best used to navigate between code windows.
- Use the code window's Procedure drop list (see Navigating Code Window Lists) to navigate between subroutines in a long code window.
- [Hold] the Project Explorer folder icon (📁) at the top of its pane to toggle between a grouped list (Folder) and a straight list. Making this change in any one Office application will affect all Office applications.
- To maximize the code window, close all other windows and panes.
- To directly edit a name in Excel or Word, press <Alt>F8, select the macro name, then [Click] OK.
- Press <Alt>Q to close the VBA Editor and return to its Office application.

Using Code Window Lists

Object List	Procedure List

The Object and Procedure drop lists sit at the top of any code window. They can be used to navigate between subroutines or create event-triggered code.

1. Select an appropriate item from the Object drop list.
2. Then select an appropriate item from the Procedure drop list.
3. Write code into the newly created subroutine. For example, a subroutine can be created to validate Access form data, with record entries rejected, before the form is saved. Select the BEFOREUPDATE event from the PROCEDURE list at the top of the form's code window. A new subroutine is automatically created called Sub Form BeforeUpdate (Event) in the Project's front validation code and it will run just before the form's contents are saved.

Navigating Code Window Lists

Object List Items

GENERAL: Displays all existing subroutine and function procedures.

WORKBOOK or WORKBOOK: Displays code for the selected Excel workbook or workbook.

DOCUMENT: Displays code for a selected Word document.

[Name of Control]: Displays code for the Access object or sub-object within the selected form or report.

Procedure List Items

DECLARATIONS: To jump to a code window's Dim Sections area above the first procedure.

[Event Name]: To create a procedure or to display code that acts on the selected object.

[Procedure Name]: To navigate to an existing procedure within a code window.

Useful Keyboard Shortcuts

- Shift + F10: Hold this key down while opening an Office application and its AutoOpen code will be bypassed.
- Ctrl-Break: Stops running code. This key combination is particularly useful in halting infinite loops.
- Shift + F2: Displays the VBA Editor Object Browser definition of an object, method, or property selected in a code window.
- Alt + F8: Display a list of macros in Excel or Word.
