Name: _____

1. Distinguish between the central nervous system (CNS) and the peripheral nervous system (PNS).

Division of the Nervous System	Components
CNS	brain and spinal cord
PNS	cranial and spinal nerves

2. Identify the cells in the nervous system.

Name of Cell	Description
Neuron	consists of a cell body, dendrites, and an axon and transmits electrochemical messages
Microglia	phagocytic cell that removes bacteria and debris
Astrocytes	provides metabolic and structural support and is involved in synapse formation and homeostasis
Oligodendrocyte	forms myelin in the CNS
Shawann cell	forms myelin in the PNS
Sensory neurons	carries nerve signals from a sensory receptor to the CNS
Interneurons	receives input from sensory neurons and other interneurons, and communicates with motor neurons, located in the CNS
Motor neuron	carries electrochemical messages to an effector (e.g., muscle cell, organ, or gland)

The Oxford Handbook of Invertebrate Neurobiology John H. Byrne, 2019-01-29 Invertebrates have proven to be extremely useful model systems for gaining insights into the neural and molecular mechanisms of sensory processing motor control and higher functions such as feeding behavior learning and memory navigation and social behavior A major factor in their enormous contributions to neuroscience is the relative simplicity of invertebrate nervous systems In addition some invertebrates primarily the molluscs have large cells which allow analyses to take place at the level of individually identified neurons Individual neurons can be surgically removed and assayed for expression of membrane channels levels of second messengers protein phosphorylation and RNA and protein synthesis Moreover peptides and nucleotides can be injected into individual neurons Other invertebrate model systems such as *Drosophila* and *Caenorhabditis elegans* offer tremendous advantages for obtaining insights into the neuronal bases of behavior through the application of genetic approaches The Oxford Handbook of Invertebrate Neurobiology reviews the many neurobiological principles that have emerged from invertebrate analyses such as motor pattern generation mechanisms of synaptic transmission and learning and memory It also covers general features of the neurobiology of invertebrate circadian rhythms development and regeneration and reproduction Some neurobiological phenomena are species specific and diverse especially in the domain of the neuronal

control of locomotion and camouflage Thus separate chapters are provided on the control of swimming in annelids crustacea and molluscs locomotion in hexapods and camouflage in cephalopods Unique features of the handbook include chapters that review social behavior and intentionality in invertebrates A chapter is devoted to summarizing past contributions of invertebrates to the understanding of nervous systems and identifying areas for future studies that will continue to advance that understanding
