Introduction

- Sequencing of the human genome was completed by 2007
- DNA sequencing has depended on advances in technology, starting with making recombinant DNA
- In **recombinant DNA**, nucleotide sequences from two different sources, often two species, are combined *in vitro* into the same DNA molecule

- DNA technology has launched a revolution in **biotechnology**, the manipulation of organisms or their components to make useful products.
 - Microbes to make wine and cheese and the selective breeding of livestock, are examples of biotechnology.
 - Now biotechnology based on manipulations of DNA enables scientists to modify genes and move them between organisms like, bacteria, plants, and animals.
- DNA technology is now applied in areas ranging from agriculture to criminal law, but its most important achievements are in basic research.

Uses:

Food crops:

delayed ripening/spoilage

disease and insect resistance

salt resistant gene put in rice in India

rice with beta-carotene for vitamin A (prevents blindness)- a staple in the diets of many in SE Asia

Cleaning up toxic wastes: take genes from bacteria that can clean toxic wastes and put in another organism
