

Investigation Chapter 1: Tire Story Falls Flat - Camilla Perego

PART I. A legendary story on college campuses concerns two students who miss a chemistry exam because of excessive partying but blame their absence on a flat tire. The professor allows them to take a make-up exam, and sends them to separate rooms to take it. The first question, worth five points, is quite easy. The second question, worth ninety-five points, asks: Which tire was it?

Step 1: Ask a research question

Do students pick which tire went flat in equal proportions? It has been conjectured that when students are asked this question and forced to give an answer (left front, left rear, right front, or right rear) off the top of their head, they tend to answer "right front" more than would be expected by random chance.

Step 2: Design a study and collect data

To test this conjecture about the right front tire, a recent class of 28 students was asked if they were in this situation, which tire would they say had gone flat. We obtained the following results:

Left front	Left rear	Right front	Right rear
8	4	12	4

1. What are the observational units?

The observational units are the students

2. What is the variable that is measured/recorded on each observational unit?

Choice of tire

3. Describe the parameter of interest in words. (You can use the symbol π to represent this parameter.)

π = the parameter is the long-run probability of choosing the right front tire as an answer

4. State the appropriate null and alternative hypotheses to be tested.

$H_0: \pi = 0.25$

$H_a: \pi > 0.25$

Step 3: Explore the data

5. What percentage of the students picked the right front tire? Is this more than you would expect if students randomly pick one of the four tires?

12 students out of 28 picked the right front tire (42.8%). It is more than we would expect if students randomly pick one of the four as the probability in that case would be 25%. $42.8\% > 25\%$

6. Is it possible that we could observe 14 students from this class of 28 students even if all of the students were just selecting randomly among the four tires?

Yes it is possible that 14 students out of 28 would randomly pick the right front tire. However, I would consider it unlikely since it is more than the long-run probability

Step 4: Draw inferences

Let's use our 3S strategy to help us investigate how much evidence the sample data provide to support our conjecture that there is something special about the right front tire.
