

Chapter 1: Overview of Genetics

- **The Human Genome Project:** began in the US in 1990 when the National Institutes of Health and the Department of Energy joined forces with international partners to decipher the massive amount of information contained in our **genome:** the DNA found within all of our chromosomes
 - o In only a decade, they determined the DNA sequence of over 90% of the human genome
 - o Completed sequence published in 2003; over a 99.99% accuracy
- **The 1000 Genomes Project:** started in 2008; launched to establish a detailed understanding of human genetic variation
 - o In this international project, researchers set out to determine the DNA sequence of at least 1000 anonymous participants from around the globe
 - o In 2015, the sequencing of over 2500 genomes was described in the journal *Nature*
- The results of the Human Genome Project and the 1000 Genomes Project have shed considerable light on basic questions, like how many genes we have, how genes direct the activities of living cells, how species evolve, how single cells develop into complex tissues, and how defective genes cause disease
 - o Has lend itself to improvements in modern medicine by leading to better diagnoses of diseases and the development of new treatments for them
- New technologies
 - o researchers have developed genetics techniques to produce medicines, such as human insulin, that would otherwise be difficult or impossible to make
 - Human insulin is synthesized in strains of *E. Coli* bacteria that have been genetically altered by the addition of genes that encode the polypeptides that form this hormone
 - o Mammalian cloning
 - In 1997, Ian Wilmut and his colleagues created clones of sheep, using mammary cells from an adult animal. More recently, such cloning has been achieved in several mammalian species, including cows, mice, goats, pigs, and cats
 - In 2002, the first pet was cloned, a cat named CC
 - The cloning of mammals provides the potential for many practical applications. With regard to livestock, cloning would enable farmers to use cells from their best individuals to create genetically homogenous herds. This could be advantageous in terms of agricultural yield, although such a genetically homogenous herd may be more susceptible to certain diseases
 - o Provide the means to modify the traits of animals and plants in ways that would have been unimaginable just a few decades ago
 - Ex: Green Fluorescent Protein (GFP)
 - Certain species of jellyfish emit a "green glow" produced by a gene that encodes a bioluminescent protein called GFP. When
