The object of this work was to determine the injection timing requirements of a modern Diesel engine over its entire operating range. This was done by conducting performance tests at various injection timing settings for quarter half three quarter and full load conditions at 600 900 1200 1500 and 1800 rpm. The engine tested was a single cylinder four cycle Diesel manufactured by the Nordberg Manufacturing Company. Results indicate that the engine is relatively insensitive to changes in injection timing but that it was possible to obtain up to 13.5 per cent improvement in economy with variable injection timing. The injection timing should have been advanced if the speed were increased or if the load were increased. The injection timing should not have been advanced to more than 32.5 degrees before top dead center nor retarded to less than 12.5 degrees before top dead center.

The GM Diesel Model 1 53X3 is a single cylinder two stroke cycle engine rated at 30 hp at 3000 rpm. It was developed with both two and four exhaust valve cylinder heads. Variable exhaust and injector cam shaft gears have been added to facilitate changes in timing. The purpose of this investigation was to determine the effects of the variation of exhaust and fuel injection timing on engine performance. A piezoelectric pressure pickup was used to obtain oscilloscope displays of pressure versus crank angle which were photographed. Injection from 20 deg BTC to 5 deg BTC for three exhaust timing configurations have been investigated for

each head Engine performance data under these conditions are presented and discussed The engine as instrumented lends itself to a variety of student exercises and demonstrations Author [Diesel Engines.
