

- b. What is the maximum number of divisions made by Euclid's algorithm among all inputs $1 \leq m, n \leq 10^7$?
10. a. Euclid's algorithm, as presented in Euclid's treatise, uses subtractions rather than integer divisions. Write pseudocode for this version of Euclid's algorithm.
- b. ► *Euclid's game* (see [Bog]) starts with two unequal positive integers on the board. Two players move in turn. On each move, a player has to write on the board a positive number equal to the difference of two numbers already on the board; this number must be new, i.e., different from all the numbers already on the board. The player who cannot move loses the game. Should you choose to move first or second in this game?
11. The *extended Euclid's algorithm* determines not only the greatest common divisor d of two positive integers m and n but also integers (not necessarily positive) x and y , such that $ax + by = d$.
- a. Look up a description of the extended Euclid's algorithm (see, e.g., [Knul, p. 13]) and implement it in the language of your choice.
- b. Modify your program to find integer solutions to the Diophantine equation $ax + by = c$ with any set of integer coefficients a , b , and c .
12. ▷ *Locker doors*. There are n lockers in a hallway, numbered sequentially from 1 to n . Initially, all the locker doors are closed. You make n passes by the lockers, each time starting with locker #1. On the i th pass, $i = 1, 2, \dots, n$, you toggle the door of every i th locker: if the door is closed, you open it; if it is open, you close it. After the last pass, which locker doors are open and which are closed? How many of them are open?

Anany Levitin 3rd Edition Solution
