LAB 8: STELLAR CLASSIFICATION AND THE H-R DIAGRAM

1 Introduction

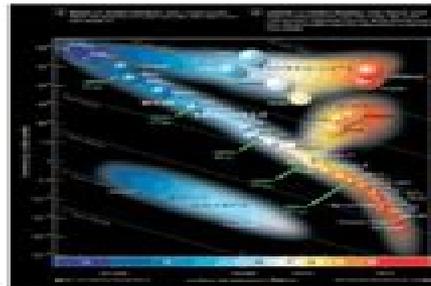

Stellar Classification

As early as the beginning of the 19th century, scientists have studied absorption spectra in an effort to classify stars. At first, spectra were divided into groups by general appearance; however, in the 1930's and 1940's, astronomers realized that spectral type was mainly determined by temperature instead of chemical composition. As a result, spectral types were refined and renamed with letters, leading to the familiar "O, B, A, F, G, K, M" system. Each spectral class is then divided into tenths, so that a B0 star follows an O9, etc. In this scheme, our Sun would be labeled a type G2 star. The classification system we use today, called the MK system, adds a Roman numeral to the end of the spectral type, indicating the so-called luminosity class (ex. a I indicates a supergiant, a III a giant star, and a V a main sequence star). In this new system, our Sun (a typical main-sequence star) becomes a G2V.

Spectral type allows astronomers to know not only the temperature of the star, but also its luminosity and color. These properties can help in determining the distance, mass, and other physical quantities associated with the star, its surrounding environment, and its past history, making spectral classification a fundamental piece of our understanding of the nature and evolution of stars.

Hertzsprung-Russell Diagrams

One of the most useful tools an astronomer has for studying the evolution and age of stars is the Hertzsprung-Russell (or H-R) Diagram, a graph of surface temperature versus luminosity, on which is
