

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms producing?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Do they?

Do they depend both on the numbers of firms producing?

Do they depend on the price elasticity of demand and supply and on whether you have

monopoly or are facing competition? Do they depend on the opportunity cost of your time, or on the timing of your purchase or sale?

Do they depend on the way that you want to estimate elasticity? Do they depend on how many firms produce? How does an increase in the number of firms affect elasticity?

Answers:

- Some price elasticity measures that don't and various opportunity changes in elastic variables
 - One type of elasticity measures how much demand for one variable will fall if another variable
- Definition:
 - Elasticity is a numerical measure of the responsiveness of Q^D or Q^S to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will take the absolute value and report elasticities as positive numbers.

Example:

The price elasticity of demand for apples is 0.75. If the price of apples falls by 4 percent,

Calculating Percentage Change

Quantity demanded will increase by _____ percent.

Answer: 3%

0.75 times 4 percent = 3 percent
