

# The Digestive System

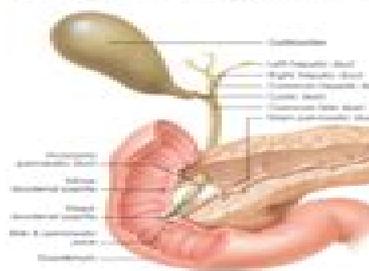

## What is the digestive system?

The digestive system, or gastrointestinal tract, is a complex of organs in which foods, beverages, and other nutrients are broken down into smaller molecules that can be absorbed into the bloodstream. The process begins in the mouth, where food is chewed and mixed with saliva. The resulting bolus is then swallowed and moves down the esophagus into the stomach. In the stomach, food is further broken down and mixed with gastric juices. The resulting chyme then moves into the small intestine, where most of the digestion and absorption of nutrients occurs. The small intestine is divided into three parts: the duodenum, the jejunum, and the ileum. The chyme then moves into the large intestine, where water is absorbed and the remaining waste is prepared for excretion in the rectum and anal canal.

## Liver, pancreas & gallbladder

After leaving the stomach, chyme enters the duodenum, the first part of the small intestine. Here, the chyme is mixed with bile from the gallbladder and pancreatic juice from the pancreas. The gallbladder stores bile, which is produced by the liver. The pancreas produces pancreatic juice, which contains enzymes that help break down food. Both the gallbladder and the pancreas secrete their fluids into the duodenum.

## Layers of large intestine

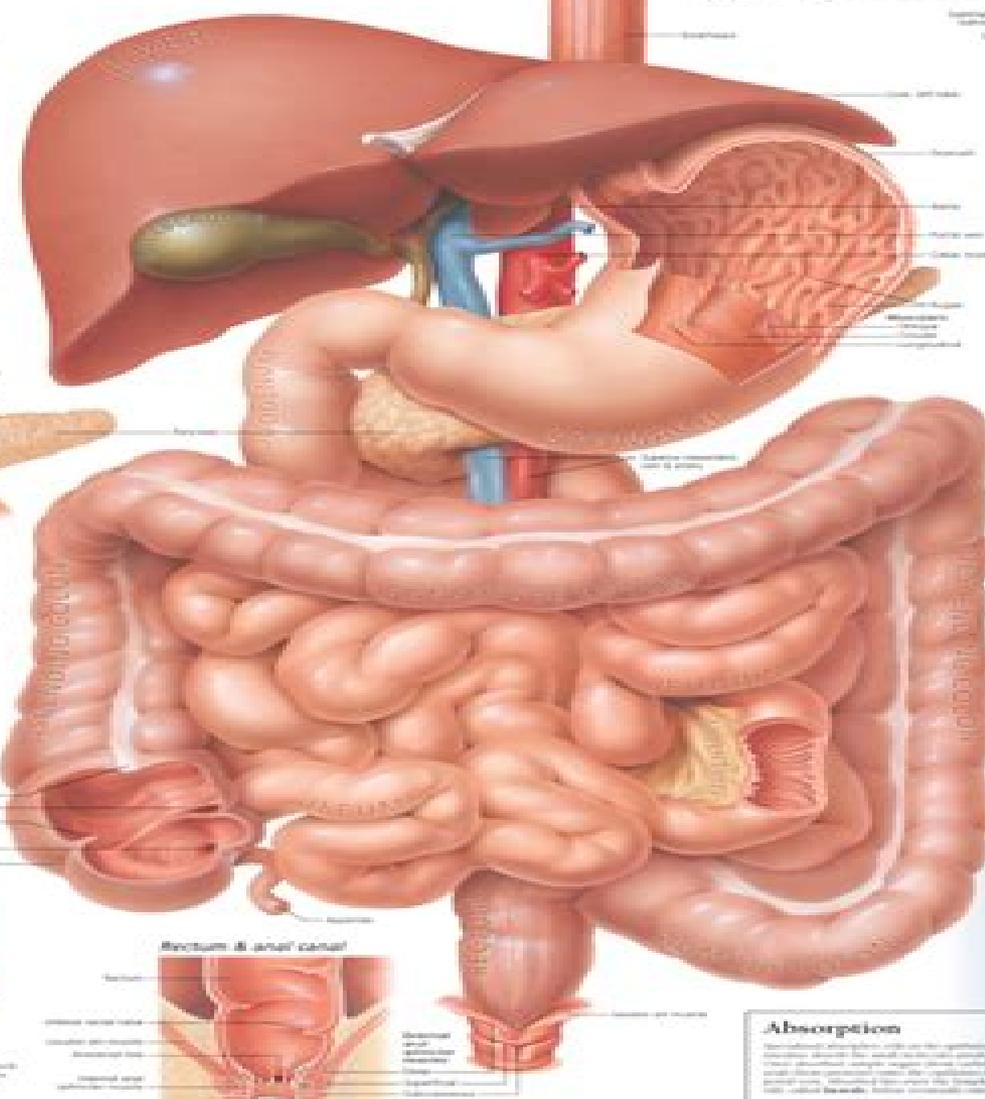

## Large intestine

The large intestine consists of the cecum, the appendix, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. The large intestine is responsible for absorbing water and electrolytes from the remaining indigestible food matter. It also produces and stores feces.

## Peristaltic action

Peristaltic action is the rhythmic contraction and relaxation of the muscles of the digestive tract. This action moves food through the digestive tract and helps mix it with digestive juices.

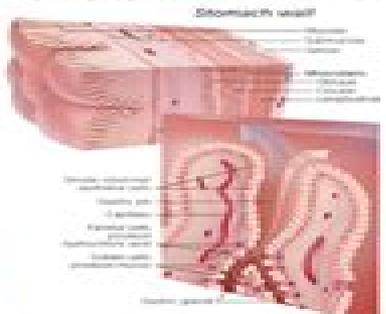

## The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, which is produced by the salivary glands, helps to moisten the food and begins the digestion of carbohydrates. The salivary glands are located in the mouth and neck. The parotid gland is the largest and is located in the neck. The sublingual gland is located under the tongue, and the submandibular gland is located under the jaw.

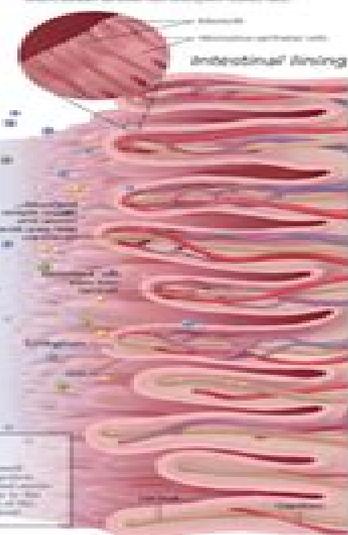

## The stomach

The stomach is a large, muscular organ that is responsible for the digestion of food. It is located in the upper abdomen. The stomach has a thick, muscular wall that contracts to mix food with gastric juices. The stomach is divided into two main parts: the fundus and the antrum. The fundus is the upper part of the stomach, and the antrum is the lower part. The stomach is connected to the esophagus at the top and to the small intestine at the bottom.

## Small intestine

The small intestine is a long, narrow tube that is responsible for the digestion and absorption of nutrients. It is divided into three parts: the duodenum, the jejunum, and the ileum. The duodenum is the first part of the small intestine and is connected to the stomach. The jejunum is the middle part, and the ileum is the last part, which is connected to the large intestine. The small intestine has a highly convoluted structure to increase its surface area for absorption.

## Absorption

Absorption is the process by which nutrients are taken up by the cells of the digestive tract. Most of the absorption of nutrients occurs in the small intestine. The nutrients are then transported to the liver through the portal vein. The liver processes these nutrients and distributes them to the rest of the body.
