

# Longitudinal Motion (Stick Fixed)

"The equilibrium and stability of a fixed-winged airplane in an unaccelerated or gliding condition have in the past been the subject of considerable speculation, and the extremely explanatory of the principles involved have hitherto been given."

Frederick W. Lanchester, *Aerodynamics* [4.1], published in 1909, in which he develops an elementary theory of longitudinal dynamic stability.

## 4.1

### HEURISTIC PERSPECTIVE

The theoretical basis for the analysis of flight vehicle motion developed almost concurrently with the successful demonstration of a powered flight of a human-carrying airplane. As early as 1897, Frederick Lanchester was studying the motion of gliders. He conducted experiments with hand-launched gliders and found that the glider would fly along a straight path if there were launched at what he called the glider's natural speed. Lanchester the glider at a higher or lower speed would tend to oscillatory motion. He also noticed that, if launched at its "natural speed" and then disturbed from its flight path, the glider would soon stabilize along its flight trajectory. What Lanchester had discovered was that all flight vehicles possess certain natural frequencies or motions when disturbed from their equilibrium flight.

Lanchester called the oscillatory motion the glided motion. He wanted to see the glider oscillate saying "no fly" he described his newly discovered motion, initially, glided motion "no fly." Today, we still use the term glided to describe the long period slowly damped oscillation associated with the longitudinal motion of his airplane.

The mathematical treatment of flight vehicle motions was first developed by G. H. Bryan. He was aware of Lanchester's experimental observations and set to develop the mathematical equations for dynamic stability analysis. His stability work was published in 1911. Bryan made significant contributions to the analysis of vehicle flight motions. He laid the mathematical foundation for airplane dynamic stability analysis, developed the concept of the aerodynamic stability derivatives, and recognized that the equations of motion could be rearranged into a systematic longitudinal motion and an equilibrium lateral motion. Although the mathematical treatment of airplane dynamic stability was developed over the years, the first
