

Chapter 1. Introduction to Computing

The electronic computer is one of the most important developments of the twentieth century. Like the industrial revolution of the nineteenth century, the computer and the information and communication technology built upon it have drastically changed business, culture, government and science, and have touched nearly every aspect of our lives. This text introduces the field of computing and details the fundamental concepts and practices used in the development of computer applications.

Entering into a new field like computing is a bit like going to work in a country that you have never visited before. While all countries share some fundamental features such as the need for language and propensities for culture and trade, the profound differences in these features from one country to the next can be disorienting and even debilitating for newcomers. All computing is based on the coordinated use of computer devices, called *hardware*, and the computer programs that drive them, called *software*, and all software applications are built using data and process specifications, called *data structures* and *algorithms*. These fundamentals have remained remarkably stable over the history of computing, in spite of the continual advance of the hardware and software technologies, and the continual development of new paradigms for data and process specifications.

This chapter defines the notion of computing, discusses the concepts of hardware and software, and concludes with an introduction to the development of software, called *computer programming*. The remainder of the text focuses in on the development of computer software, providing a detailed discussion of the principles of software as well as a snapshot of the current culture of the software development field. Processing, a Java-based development environment, is used throughout the first half of the text; the text then transitions to use of the full Java development environment.

1.1. Computing

As noted above, the definition of computing is hard to pin down, but the *Computing Curricula 2005: The Overview Report* prepared by a joint committee of ACM, IEEE, and AIS gives the following definition: "In a general way, we can define computing to mean any goal-oriented activity requiring, benefiting from, or creating computers." This is a very broad definition that comprises the development of computer hardware, the use of computer applications, and the development of computer software. This text focuses on the last of these enterprises, the development of computer software.

Because software development is based on computer hardware, this chapter will discuss the general
