Nuclear Science Abstracts ,1966      **Transcriptomics in Health and Disease** Geraldo A. Passos,2015-01-27 After sequencing the human genome a decade ago researchers have continued their projects but now to try to better understand how and when genes are expressed in health and disease Efforts have been concentrated on the measurement of the expression of RNA transcripts In an analogy to the genome the term transcriptome was created to refer to the complete set of RNAs in a cell type or tissue in a particular situation Transcriptomics is the science that studies this issue and it is a branch of functional genomics Transcriptomics in Health and Disease provides a comprehensive overview of the science of transcriptomics initially in health focusing on the concept of the transcriptome and the main methods to evaluate it The authors discuss the concept and use of gene expression signatures and transcriptional biomarkers in normal development and diseased tissues and organs As the transcriptome changes depending on the pathology there is also a focus on the variations in the gene expression in different diseases such as autoimmune inflammation cancer and infections This book should be very useful for researchers in molecular biology focusing on gene expression human genetics immunology and genomics

Immune system modeling and analysis Ramit Mehr,Miles Davenport,2015-04-22 The rapid development of new methods for immunological data collection from multicolor flow cytometry through single cell imaging to deep sequencing presents us now for the first time with the ability to analyze and compare large amounts of immunological data in health aging and disease The exponential growth of these datasets however challenges the theoretical immunology community to develop methods for data organization and analysis Furthermore the need to test hypotheses regarding immune function and generate predictions regarding the outcomes of medical interventions necessitates the development of mathematical and computational models covering processes on multiple scales from the genetic and molecular to the cellular and system scales The last few decades have seen the development of methods for presentation and analysis of clonal repertoires those of T and B lymphocytes and phenotypic surface marker based repertoires of all lymphocyte types and for modeling the intricate network of molecular and cellular interactions within the immune systems This e Book which has first appeared as a *Frontiers in Immunology* research topic provides a comprehensive online open access snapshot of the current state of the art on immune system modeling and analysis

The Transcriptional Regulation of Memory Benedict C. Albenis,Jelena Djordjevic,2016-09-06 The formation of various forms of memory involves a series of distinct cellular and molecular mechanisms many of which are not fully understood There are highly conserved pathways that are involved in learning memory and synaptic plasticity which is the primary substrate for memory storage The formation of short term across minutes memory is mediated by local changes in synapses while long term across hours to days memory storage is associated with activation of transcription and synthesis of proteins that modify synaptic function Transcription factors which can either repress or activate transcription play a vital role in driving protein synthesis underlying synaptic plasticity and memory

whereby protein synthesis provides the necessary building blocks to accommodate structural changes at the synapse that foster memory formation. Recent data implicate several families of transcription factors that appear critically important in the regulation of memory. In this Topic we will focus on the families of transcription factors thus far found to be critically involved in synaptic plasticity and memory formation. These include cAMP response element binding protein (CREB), Rel nuclear factor (B-Rel/NF- $\kappa$ B), CCAAT enhancer binding protein (C/EBP), and early growth response factor (Egr). In recent years, numerous studies have implicated epigenetic mechanisms: changes in gene activity and expression that occur without alteration in gene sequence in the memory consolidation process. DNA methylation and chromatin remodeling are critically involved in learning and memory, supporting a role of epigenetic mechanisms. Here we provide more evidence of the importance of DNA methylation, histone posttranslational modifications, and the role of histone acetylation and HDAC inhibitors in the above mentioned processes.
